★ Acid Rain & its effects.

Definition :-

"Acid rain" is a popular term referring to the deposition of the mixture from wet (rain, snow, sleet, fog, cloudwater, and dew) and dry (acidifying particles & gases) acidic components distilled water, once carbon dioxide is removed has a neutral pH of 7.

"liquid is a pH less than 7 are acidic, and those which a pH greater than 7 are alkaline "clean or unpolluted rain are acidic pH, but usually no lower than 5.7. because carbon dioxide & carbon water in the air react together to form carbonic acid, a weak acid according to the following reaction

Carbonic acid & then can ionize in water forming low concentration of carbonate & hydronium ions.

Acid Rain Can Cause Health Problem In Detail:-

Air Pollution is a like Sulphur dioxide and nitrogen oxide can cause respiratory diseases or can make this diseases worse respiratory diseases like asthma or chronic bronchitis make it hard for people to breathe. The pollution that cause acid rain can also create fine particles, when these particles get into people lungs, they can cause ~~the~~ health problems or can make existing make problems worse. also nitrogen oxide cause ground level ozone. these ground level ozone cause respiratory problem like, pneumonia and bronchitis and can even cause permanent lung damage. The health effects that people have to worry about are not caused by the acid rain but are caused when people breathe in this fine particles of ozone.
