What is Deforestation ?

Deforestation can be defined as the large scale or removal of trees from forests for the facilitation of human activities. It is a serious environmental concern since it can result in the loss of biodiversity, damage of natural habitats, disturbance in the water cycle and soil erosion.

Deforestation is also a contributor to climate change and global warming.

Deforestation is clearing Earth's forests on a massive scale, often resulting in damage to the quality of land and related ecosystems, where the land is thereafter converted to a non-forest use.

The loss of trees adversely affect every biological life in all possible ways. with time these become prominent to humankind, as well as other species inhabiting this planet. If you want to

Deforestation disturbs the ecosystem and the ecological balance in nature. It leads to unpredictable changes in weather and climate patterns across the world. It is a severe environmental concern since it can result in the loss of biodiversity, disturbances in the water cycle, damage in natural habitats, and soil erosion.

Deforestation is also a significant contribution to global warming and climate change.

* Major Causes of Deforestation *

Agricultural activities :-

Agriculture is the most important cause of deforestation on the planet comprising nearly about 50-70%.

Due to huge demand for food products huge amount of trees fell down to grow crops and for cattle grazing.

They often clear acres of trees in slash and burn technique. Beside this local cattle, goats, sheep etc. not only destroy the vegetation but also pull out the roots of the plants. Statistics shows the 60-70% of amazon forests are deforested due to cattle ranching, over grazing and the growing hunger for land have hit the ecology of India so badly that India may soon have more of wasteland than productive land.
